

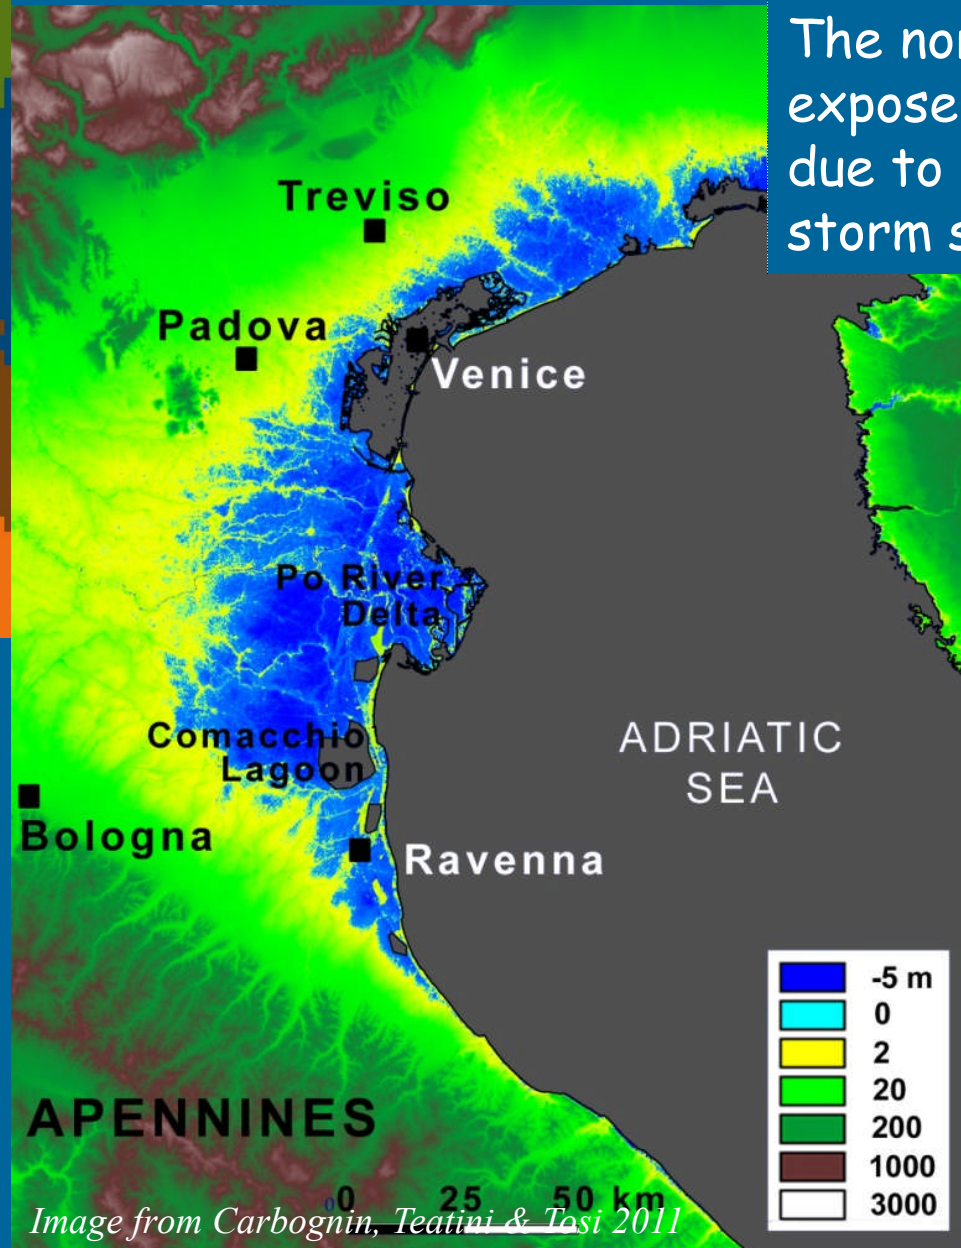

Mapping of flood risk in Emilia-Romagna coastal areas

Luisa Perini, Lorenzo Calabrese, Giovanni Salerno e Paolo Luciani

Flood risk in Emilia-Romagna coastal areas

The north-western Adriatic coast is exposed to a high - risk of flooding mainly due to exceptional sea level caused by storm surge.

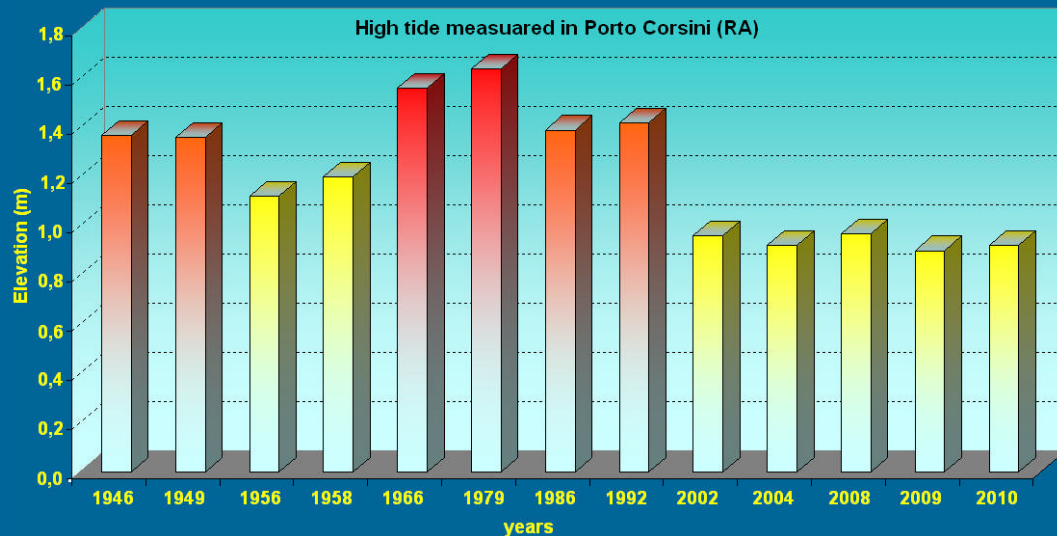

the risk is due to the extent of low-lying areas and to the high economic value of the coastal system

Physical factors

Storm surges are frequent in the Adriatic sea particularly during Autumn and Winter time; often associated to waves coming from south-east (Scirocco)

A detailed analysis of the maximum sea water levels and of the residual tide (surge component) was carried out by Masina & Ciavola within Micore project.

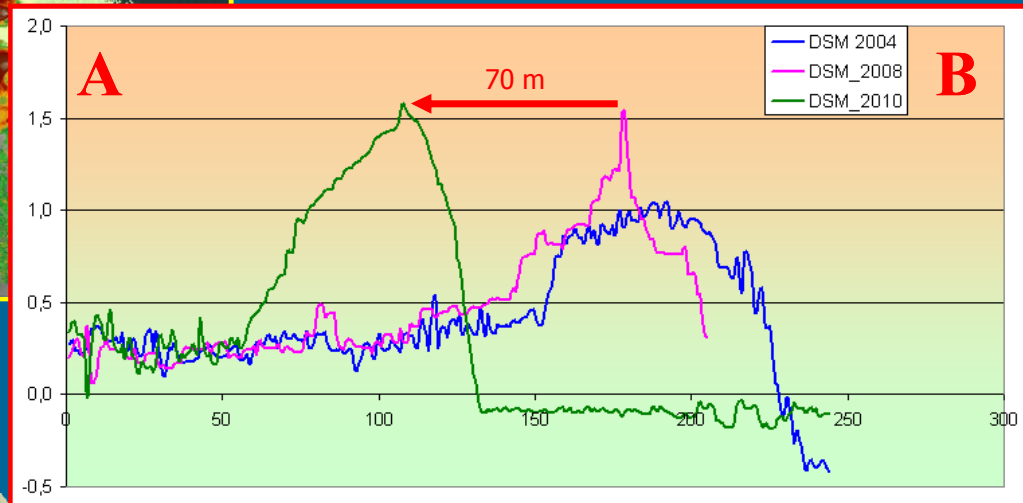

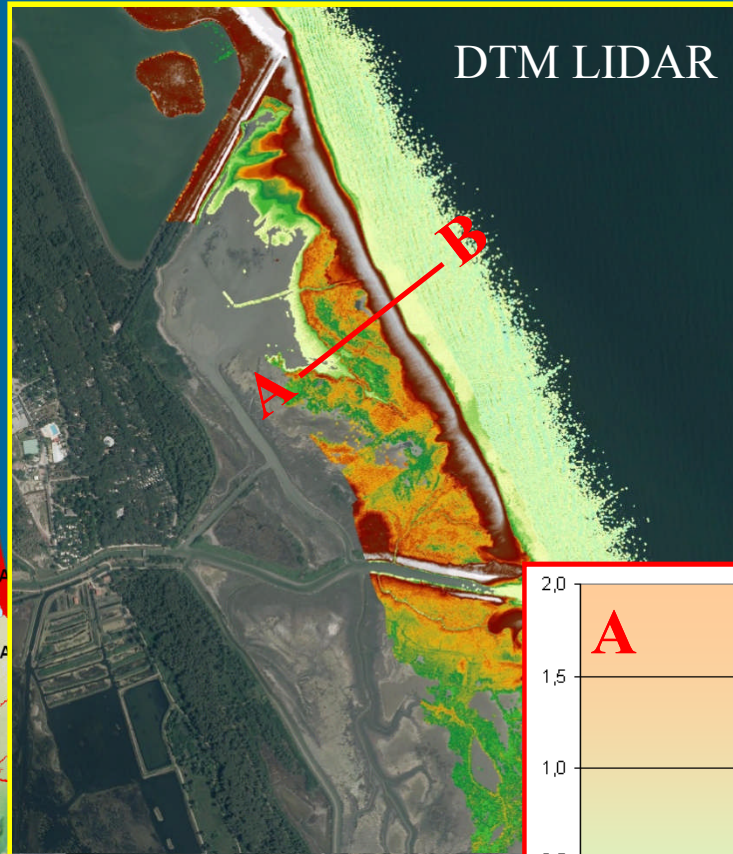

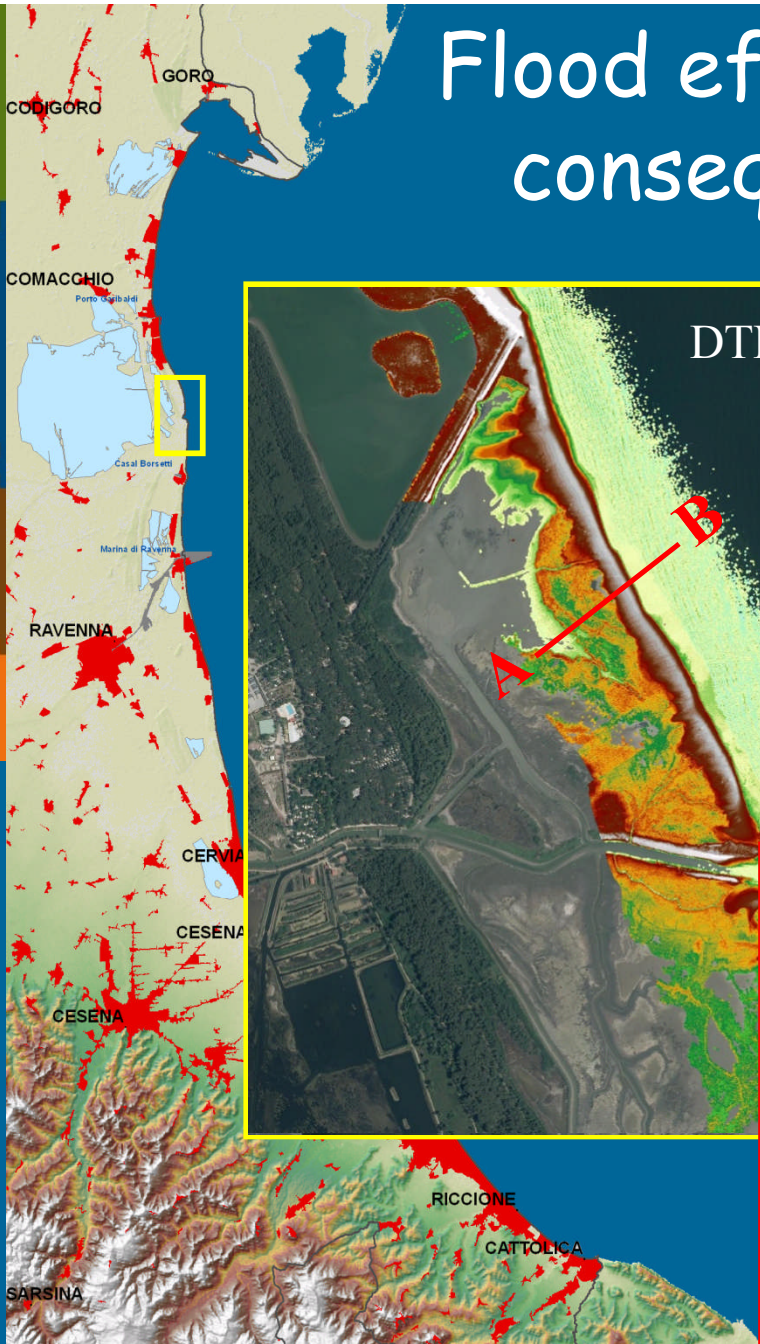

Return periods	Total water level	Residual tide
T2	0.85 m	0.61 m
T10	1.05 m	0.79 m
T100	1.28 m	1.02 m

flooding of urban areas and tourism infrastructures

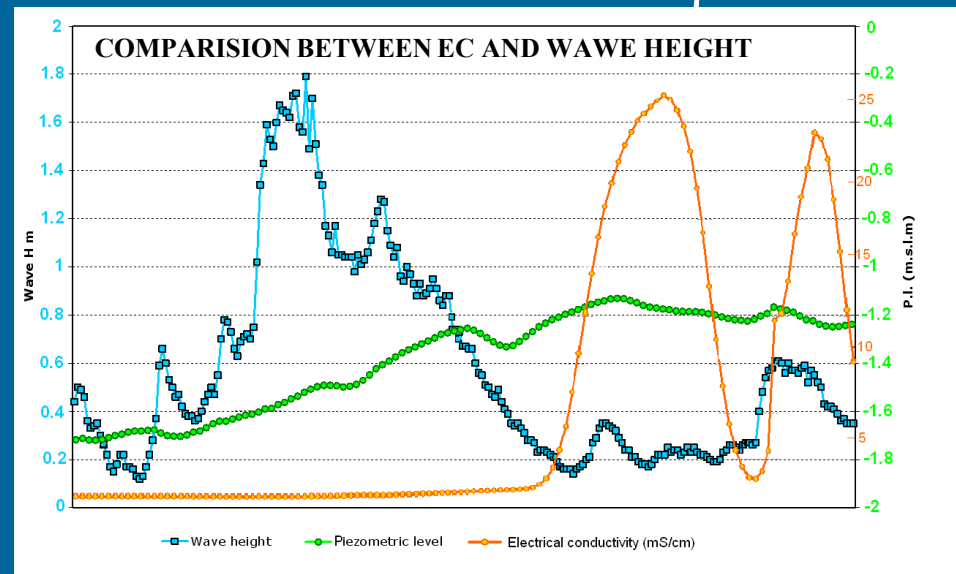

Flood effects on natural areas and consequences on the ecosystem

effects on the unconfined coastal aquifer

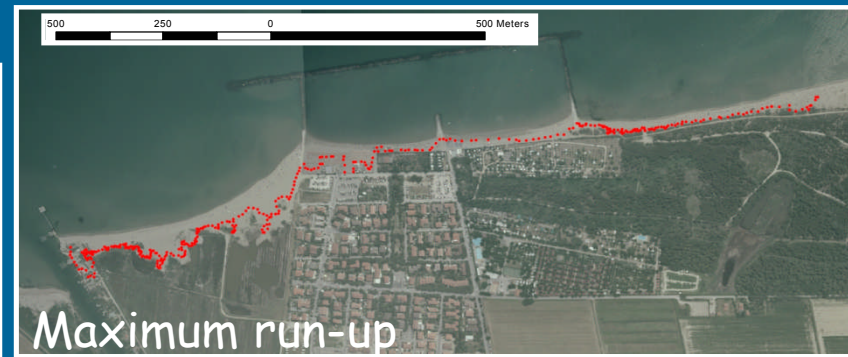

Measures of piezometric level and electrical conductivity (EC) reveal a strong connection between sea level and coastal aquifer parameters

Studies and monitoring

Classification of the most critical zones is based on:

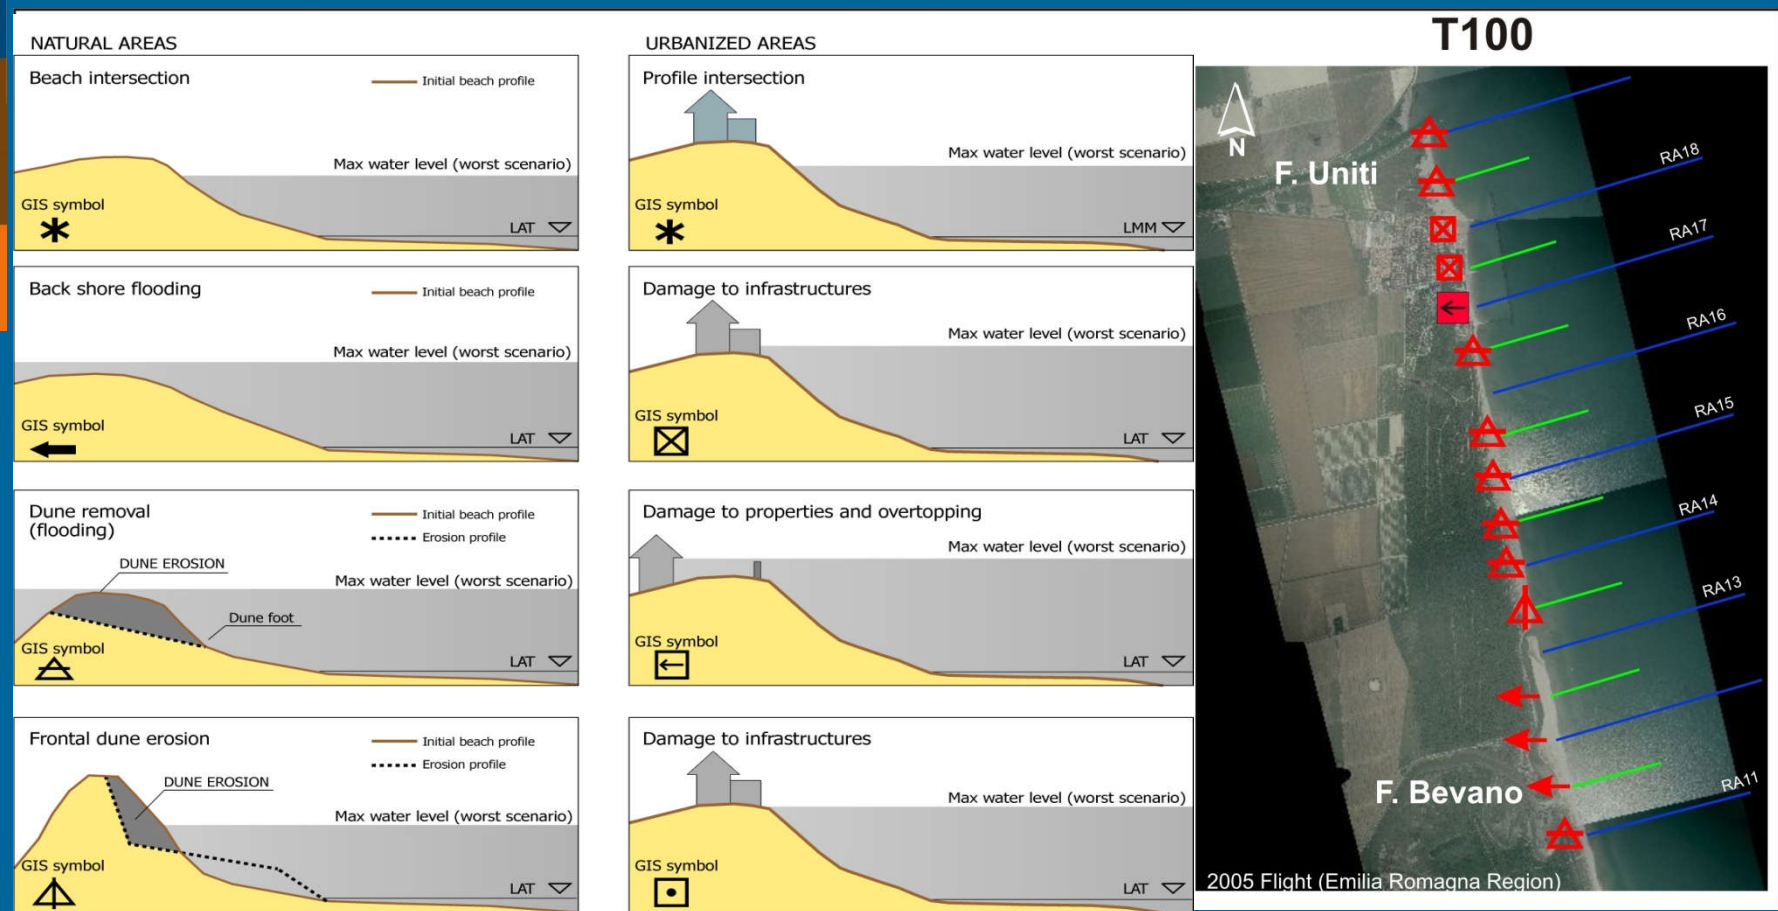

- Morphological features
- Monitoring of post-event impacts

Run-up evaluation

for T1 - T10 - T100 return periods.

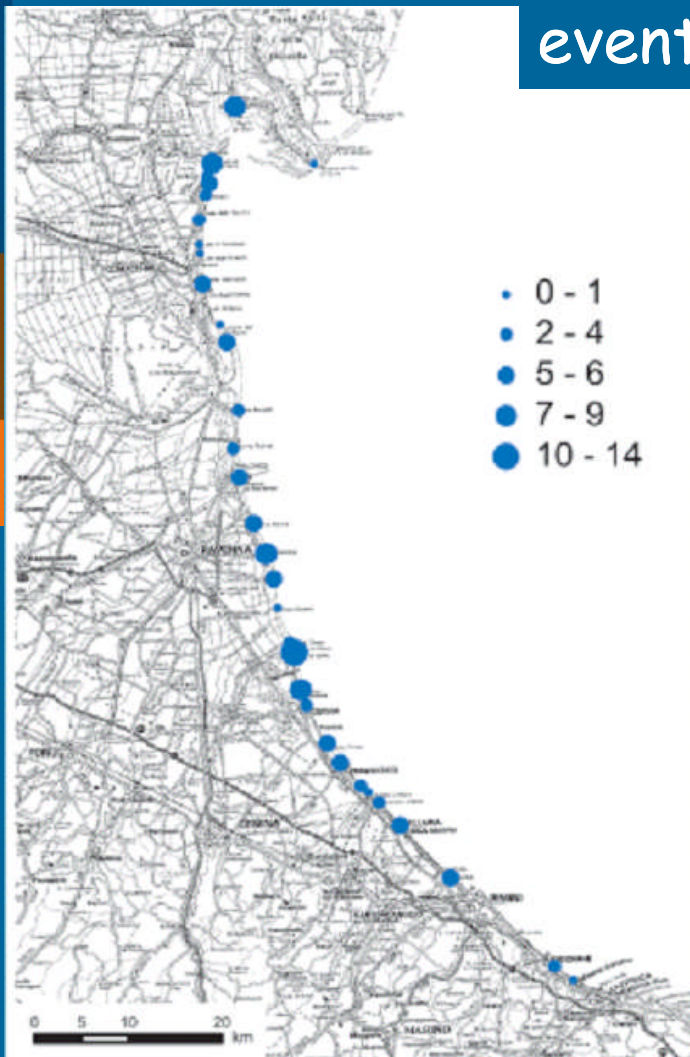

Analysis carried out along transects spaced 500 m - in collaboration with Unife (Armaroli C., Ciavola P., Masina M.)

Historical storm database

31 localities recorded flooding events in the period 1946-2010

mareggiate

Sea flooding

A new method to produce hazard maps

The new target is the risk maps as expected by
Directive 2007/60/EC (EFD) - Dlgs 49/2010

The first step, by June 2013, **flood hazard maps**

No standard protocol at national &/or european level

No specific funds dedicated at present

Conceptual method based on GIS

It's a first step of a complex procedure that requires availability of Lidar data and of the historical sea storm parameters to provide the scenarios

Comparison between topographic surface and sea level for a given hazard scenario

Identification of the pathway & exclusion of "isolated" depressed areas

Hazard scenarios

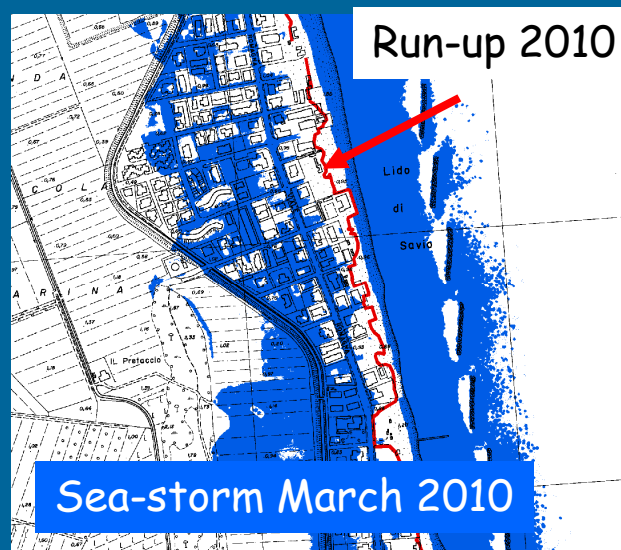

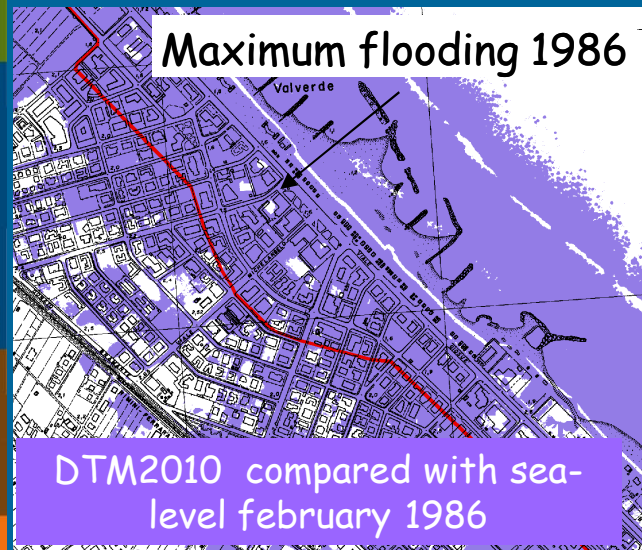

The considered scenarios combine:
storm surge + astronomical tide + wave set up

Tr (Years)	Surge	Mean high tide	Set-up	Total elevation sea surface
Tr 1	H critic = 0,61	0,4	0,22	1,22 m
Tr 10	H critic = 0,79	0,4	0,3	1,49 m
Tr100	H critic = 1,02	0,4	0,39	1,81 m

Values are derived from literature and compared to historical data from sea-storm catalogue

The damping component

defined comparing the maximum run-up and flooding lines corresponding to real past events

The GIS matrix

Defined the shortest paths for the water to reach the different areas - analysis by ArcGIS tool **Cost Distance Spatial Analyst**.

Elevation of the individual cells

0,5	0,4	0,3	2
0,6	2	0,2	0,2
0,3	2,2	2,1	0,1
0,2	0,1	0,3	0,1

Shoreline

Euclidean distance

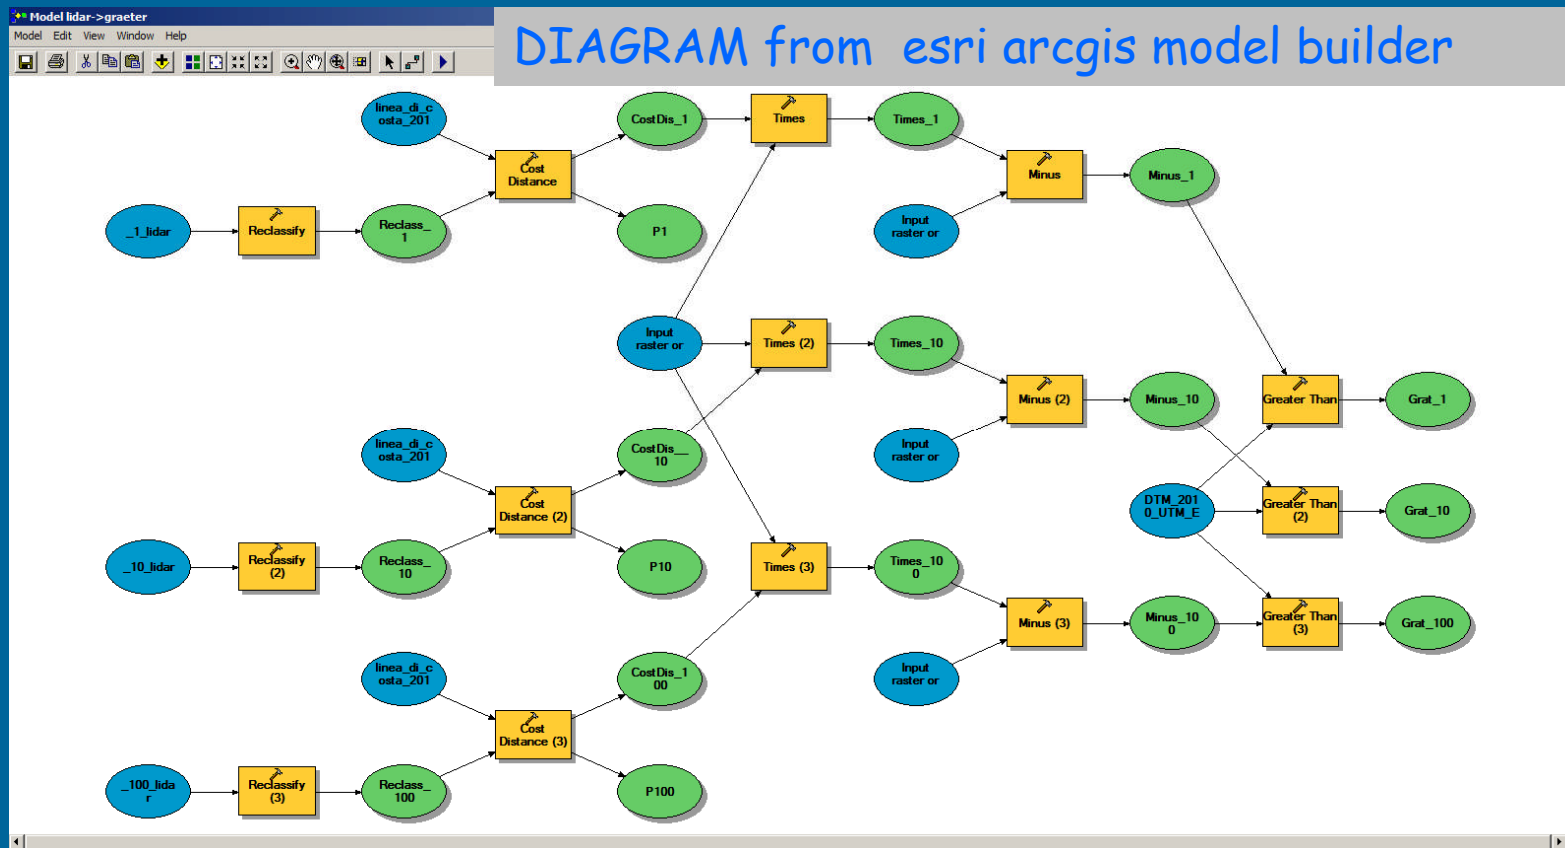

4	3	2	1
4		2	1
4			1
4	3	2	1

Cost distance

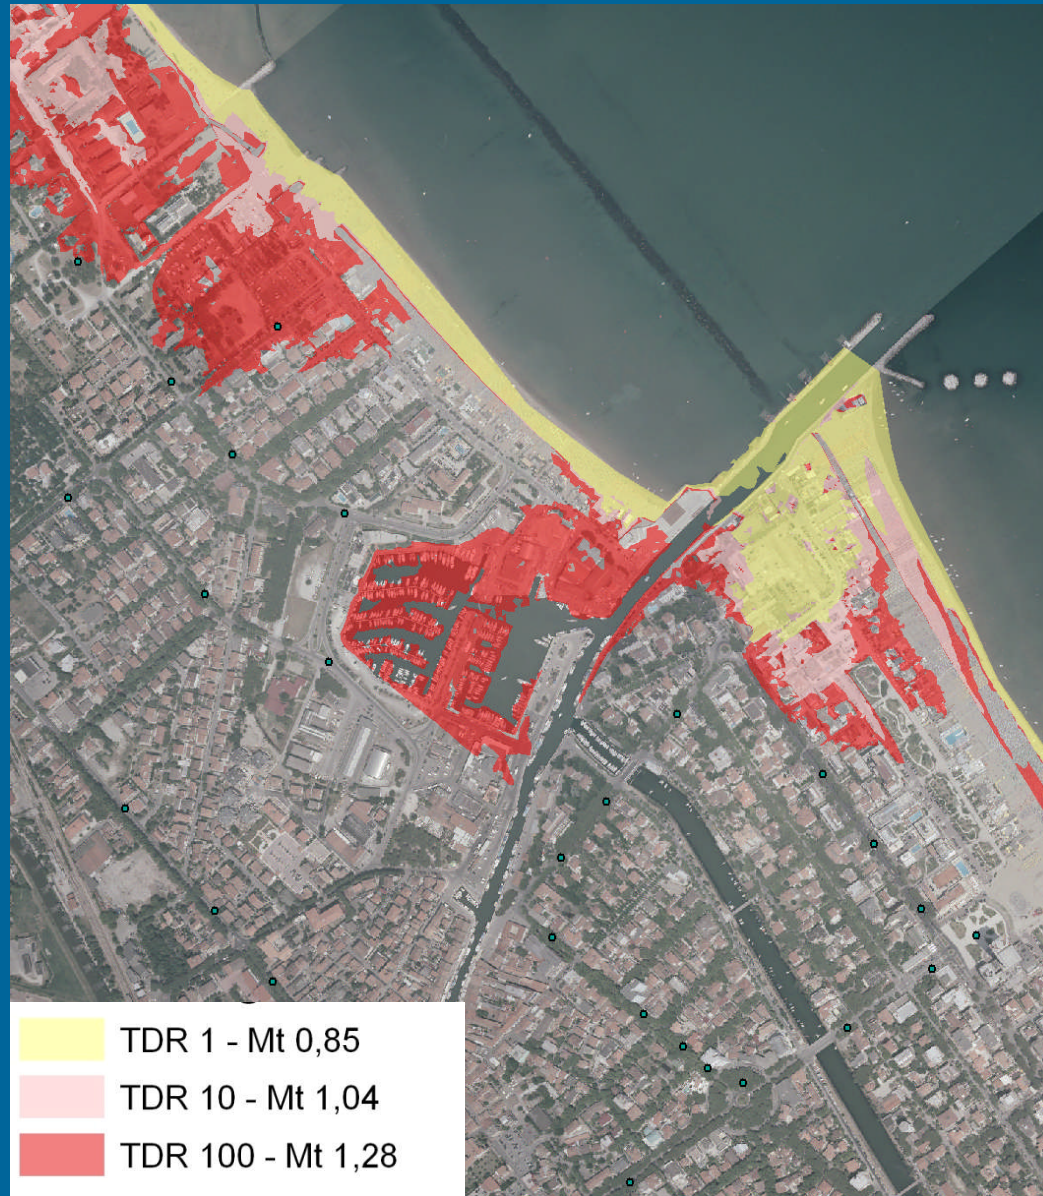

5	4	3	
6		2	1
5			1
4	3	2	1

The GIS model

for a quick re-run of the model considering different DTM, scenarios, damping factor, etc.. a diagram from esri arcgis model builder was created

Example of hazard map

Example of hazard map for Cesenatico

Ongoing and Next steps

comparison of the sea-flood hazard map with:

Run-up evaluation along 500 m spaced beach profiles

Flood maps of Cesenatico and Lido di Savio obtained using the Mike Model (Zanuttigh et al)

Validation of the results with all flooding data from sea-storm catalogue

in situ GPS measurements of evidences of future significant sea-storms

Final considerations

✓ the proposed method is
is **a fast, symple** and
economic system to
produce **flood hazard maps**

✓ indicative **water depth**
can be computed

✓ it's quite **replicable** and
exportable to other
regions if lidar data and
sea-storm scenarios are
available

✓ The GIS analysis doesn't
consider **run-up** because it
needs a dedicated formula

✓ it doesn't take into
account morphological
evolution of the beach

✓ No information
regarding **flow velocity**

Thank you for attention
