The INSPIRE Data Specification Soil and its relevance for Society

Arnold Arnoldussen, Stijn Keijers and Jan Dirk Bulens
7th EUREGEO, Bologna, 14th of June 2012

Mandate TWG INSPIRE Soil

skog+
landskap

NORWEGIAN FOREST AND
LANDSCAPE INSTITUTE

- > Development of an infrastructure for the exchange of soil data, both within the soil domain and across domain borders.
- > Focus on both present situation and future developments.
- > TWG INSPIRE Soil: Arnold Arnoldussen (TWG Facilitator), Stijn Keijers (TWG Editor), Christine Le Bas, Jandirk Bulens (TWG co-editor), Edoardo Costantini, Einar Eberhardt, Patrick Engels, Marc van Liedekerke, Stephan Marahrens, Milan Sanka, Ainara Senar, Kees Versluijs, Robert Tomas (European Commission contact point).

Need for Soil data

- > Increasing
- > Prevention and mitigation of soil degradation
- > Optimisation sustainable agricultural and forest production
- > Mitigation effects climate change
- > Mitigation effects soil contamination
- > Applications: very few at an European level; at national scale probably many hundreds. More than 100 User Requirements and Reference Material were submitted.
- > 1990s: establishment European Soil Data Base (1:1000.000) by the European Soil Bureau Network.
- > 2006: EC adopted European Soil Thematic Strategy.
- > No EU Directive is directly dealing with soils – no requirements for reporting on soils

LANDSCAPE INSTITUTE

Soil definition

- > Soils and subsoil characterised according to depth, texture, structure and content of particles and organic material, stoniness, erosion, where appropriate mean slope and anticipated water storage capacity (Inspire Directive 2007/2/EC)

Scope Soil

- > **Soil inventories**, providing one-off assessments of soil conditions and/or soil properties at certain locations and at a specific point in time, and allow soil monitoring, providing a series of assessments showing how soil conditions and/or properties change over time.
- > **Soil mapping**, providing a spatial presentation of the properties linked to the soils, including soil types; typically, soil maps are derived with the help of data available in soil inventories. Also other soil related information derived from soil properties, possibly in combination with non-soil data are within the scope.

Methodology

- > INSPIRE methodology was followed
- > 15 Use cases were studied in detail covering:
 - > Agri-Environmental Indicators (3x)
 - > Thematic maps derived from Soil information (7x)
 - > Contaminated sites (4x)
 - > Soil monitoring (1x)

Directives																				
CAP. Council regulation (EC) No 1782/2003 of 29 September 2003 establishing common rules for direct support schemes under the common agricultural policy.						•						•								
Council Directive 91/676/EEC of 12 December 1991 concerning the protection of waters against pollution caused by nitrates from agricultural sources.									•											
Directive 2000/60/EC of the European Parliament and of the Council of 23 October 2000 establishing a framework for Community action in the field of water policy.									•	•					•					
Directive 2009/28/EC of the European Parliament and of the Council. Energy from renewable resources.												•								
Directive 86/278/EC of the European Parliament and of the Council. Sewage Sludge Directive.										•										
Directive 1999/31/EC of the European Parliament and of the Council of 26 April 1999 on the landfill and waste.													•	•	•					
Less Favoured Areas (LFA) Intermediate areas. This regulation is aimed at better targeting of natural handicap payments COM (2009) 161. (regulation not adopted yet)												•								
Proposed Soil framework Directive (state of the proposal is pending)							•							•	•	•	•			

Soil model

- > One soil model distinguishing following major spatial objects:
 - > Soil profile (both observed and derived)
 - > Profile element (including soil layer and soil horizon)
 - > Soil Body
 - > Soil Derived Object
 - > Soil Theme Coverage and Soil Theme Descriptive Coverage
 - > Soil Site
 - > Soil Plot
- > In the annexes:
 - > Overview contaminated sites as a possible extension to the INSPIRE data model Soil (not to be part of legislation)
 - > Use case how to provide soil organic carbon content by using the Soil model

Monitoring

Soil profile

Soil derived information

Soil map

Soil model

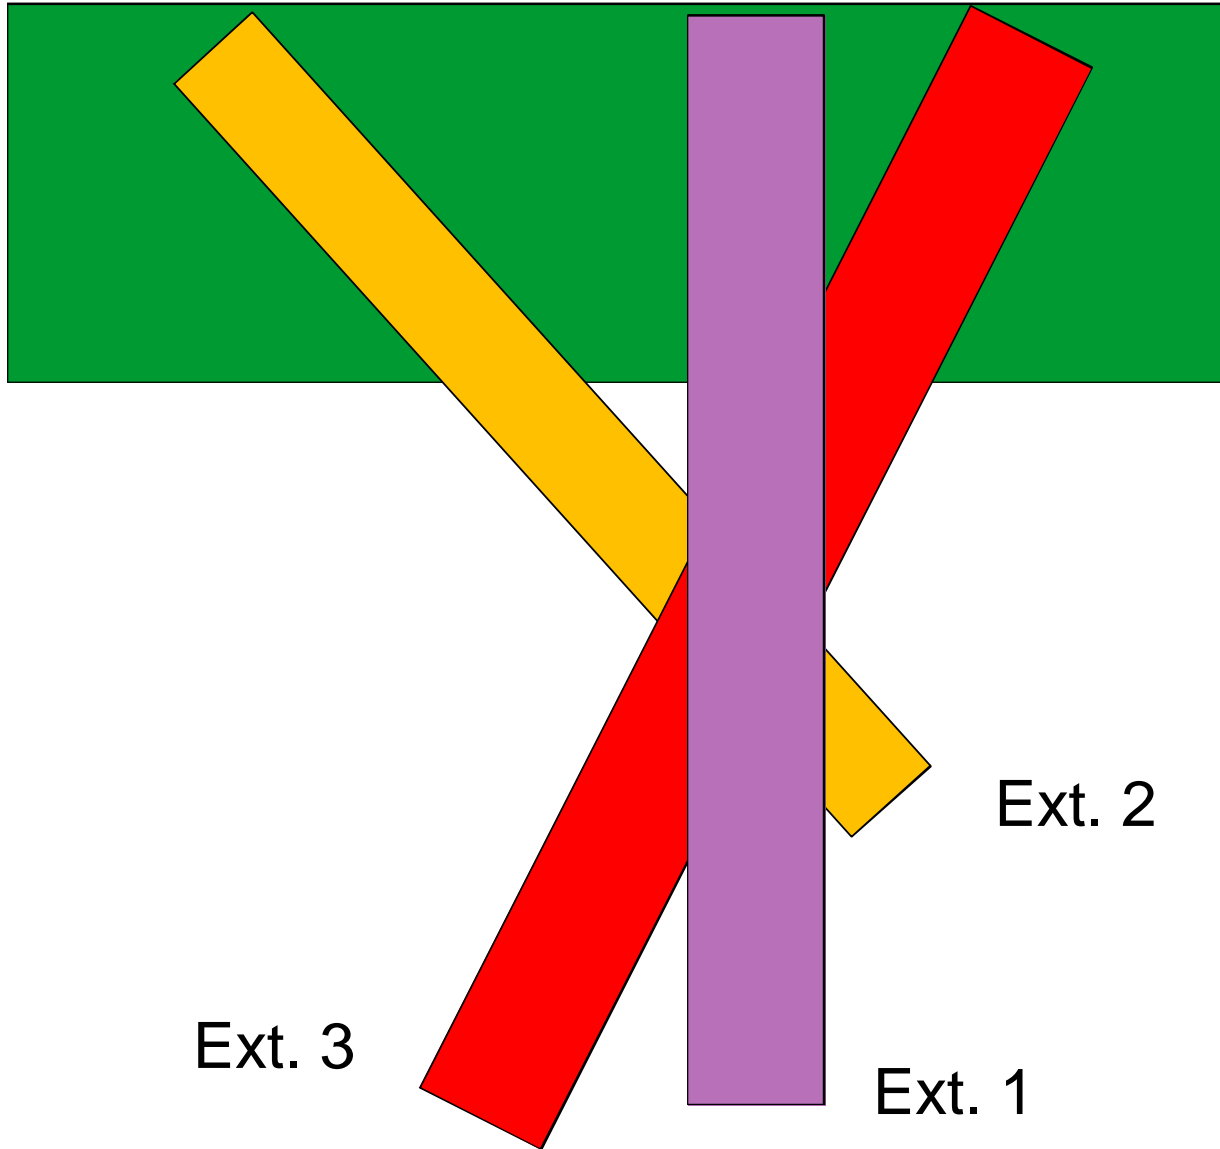

- > WRB is used as standard classification system; however it is made possible to use national classification systems in the case they are not convertible into WRB.
- > Contamination not included. Contamination treated as a chemical element in the same line as f.ex. nutrients.
- > Important parameters in the model due to adopted EU Regulations:
 - > *Soil profile*: WRB name (or national soil type), potential root depth, available water capacity, carbon stock, water drainage
 - > *Soil element*: particle size fraction, organic carbon content, N, pH, Cd, Cr, Cu, Pb, Hg, Ni, Zn
 - > *Soil derived object*: potential root depth, available water capacity, carbon stock, water drainage, particle size fraction, organic carbon content, N, pH, Cd, Cr, Cu, Pb, Hg, Ni, Zn

Relevance for Society

> INSPIRE:

- > Interoperability important
- > INSPIRE free of any scale
- > Requisite: no enforcement to do additional data capture in the field

Relevance for society (2)

skog+
landskap

NORWEGIAN FOREST AND
LANDSCAPE INSTITUTE

> INSPIRE Soil model:

- > Not a soil data base, but an infrastructure for the exchange of soil data
- > Relevance:
 - exchange of soil information across borders of territories within the same domain
 - exchange across domain borders nationally and internationally
- > Focus on these data which are relevant for one or more adopted EU regulations
- > Based on the Soil model the Implementation Rules will be written, which will be part of INSPIRE legislation. Member States will be enforced to implement them.
- > It is to be expected that the structure can be build out in future: development and implementation (voluntary) of extensions.

Thanks for your
attention
