Other Site Characteristics

Il sito comprende una serie di affioramenti ofiolitici, con prevalenza di serpentiniti su argille scagliose localizzati tra il torrente Sporzana ed il fiume Taro. Il paesaggio è dominato dalle sommità del Monte Prinzerà (736 m) e del Monte Prinzerolo (582 m) che emergono sul territorio collinare. Le formazioni geologiche sono costituite da sedimenti argillosi fortemente deformati in cui sono inclusi materiali rocciosi diversi, tra cui quelli di natura ignea. In questo settore collinare il Monte Prinzerà costituisce l'esempio di maggiore estensione ma aspri dossi minori caratterizzano tutto il versante che dal monte scende verso il Taro. Le tipologie ambientali prevalenti sono costituite da habitat rocciosi e detritici, anche con vegetazione pioniera, boschi di latifoglie riconducibili, essenzialmente, ai querceti misti tipici della fascia collinare, castagneti, praterie xerofitiche e arbustate, pascoli e colture cerealicole estensive. Il sito include quasi completamente (289 di 302 ha) la Riserva Naturale Orientata Monte Prinzerà..
