#### Other Site Characteristics

L'area consiste in arenili di recente formazione, originati dal progressivo deposito di sabbie marine: col progressivo arretramento del mare, si sono sviluppate forme vegetazionali tipiche dell'ambiente dunoso. A metà degli anni '30 è avvenuto il rimboscimento, formato lungo il perimetro da pini marittimi e all'interno da pini domestici. Nel 1966 la zona più depressa è stata invasa dal mare: l'acqua salata ha provocato la morte di molti pini e si è dovuto rimboschire privilegiando il pino marittimo, che è più resistente alla salinità. Sono state introdotte anche altre specie autoctone, quali il leccio e la farnia.
