(parte alta del calanco) e da specie perenni nelle parti basse a minor pendenza. La collocazione immediatamente a valle del boscoso versante settentrionale dei Gessi determina interessanti e caratteristiche forme di contrasto.

4.2 Quality and importance

Adattamenti di tipo alofitico, presenze endemiche, forte caratterizzazione del paesaggio e lenta evoluzione delle cenosi, mantenute allo stadio pionieristico in situazione di rifugio per flora e fauna sostanzialmente specializzate, si combinano con interessanti variazioni dovute alla diffusione di specchi d'acqua (il substrato è assolutamente impermeabile), cappellacci sabbiosi d'origine quaternaria in grado di ospitare isole forestali di querceto xerofilo e caratteristici, tenaci arbusteti di ginestra odorosa là dove si attenua la precarietà delle condizioni edafiche. I calanchi sono di fondamentale importanza per la nidificazione di *Circus pygargus* (e per altre specie legate a questi ambienti: *Caprimulgus europaeus*, *Lullula arborea*, *Anthus campestris*, *Lanius senator*)
